2. Scenario: You are a data analyst working for a company that sells products online. You have been tasked with analyzing the sales data for the past month. The data is stored in a NumPy array.

Question: How would you find the average price of all the products sold in the past month?

Assume 3x3 matrix with each row representing the sales for a different product

Program:

```
import numpy as np

sales = []

for i in range(3):

    prices = list(map(float, input("Enter prices of 3 products: ").split()))

    sales.append(prices)

sales = np.array(sales)

average_price = np.mean(sales)

print("Average price of all products:", average_price)
```

Input:

```
Enter prices of 3 products: 100 200 300
Enter prices of 3 products: 150 250 350
Enter prices of 3 products: 120 220 320
```

Output:

```
Enter prices of 3 products: 100 200 300
Enter prices of 3 products: 150 250 350
Enter prices of 3 products: 120 220 320
Average price of all products: 223.33333333333334

...Program finished with exit code 0
Press ENTER to exit console.
